

**Cybersecurity should be considered in all aspects of life:** from home, to school and work, to travel and social media. Follow these tips to protect your devices, communications, information, and identity:

**HOME**

**Configure a secure home wireless network.**

Use WPA2 128bit security with a strong password and avoid broadcasting the network name.

**WORK**

**Ensure security cameras and smart devices are secured.**

Use secure passwords and configure two-factor authentication (2FA) or VPN access to block unauthorized access.

**SCHOOL**

**Create strong passwords.**

Avoid using common words, phrases, or personal information and include uppercase and lowercase letters, numbers, and special characters.

**SOCIAL MEDIA**

**Regularly back up important data and photos to an offline storage device.**

This will ensure your personal data is preserved in the event of a malware attack, or if your device is lost, stolen, or damaged.

**TRAVEL**

**Avoid using any third-party chargers or cables.**

Plugging devices into charging bricks and cables which aren't original could infect the device with malware. Always use your own charging cables and charging bricks.

**Do not connect to unknown Wi-Fi networks.**

Public Wi-Fi is unsecure and prone to hacking attempts that can allow threat actors to intercept your sensitive communications and data.
